

# THE ST SIDETRACKER ADVANTAGE

## LARGE AND DEEP LOAD HANDLING

Sidetracker trucks are dimensionally manufactured to exactly match the load being handled.

Loads such as palletised sheet steel of any depth, sheet timber, plastic sheet, steel coils, refrigerated display cabinets, wing sections, removal company storage crates. In fact any load that standard forklifts struggle to handle safely.

The effectiveness of Sidetracker machines is due to their load

bearing decks, which form part of the structure of the truck and can be manufactured to any length to suit the depth of the load being handled. This negates the need to unnecessarily increase the capacity of the truck, avoiding making it bulky in the first place.

Based upon a load depth of 2000 mm and a weight of 6 tonnes the width of the Sidetracker is only 2770 mm and will operate in a 2900 mm wide guided aisle.
